

ABSTRACT OF THE DISCLOSURE

A backlight unit comprises: a light source for
originating light; a light guide plate including incident
5 portions through which light originated from the light
source enters and an emitting portion for emitting the
entered light; and a chassis including a first recessed
portion having a first depth and on which the light source
is located and a second recessed portion having a second
10 depth deeper than the first depth and a size adjusted for
the light guide plate and on which the light guide plate
is located.
